Firmware Release Notes for the Receiver

Version 2.1.0 Released June 2015

1. Suppressed some announcements at apogee on low altitude flights so that Kate spends less time talking about max velocity, max acceleration, apogee bearing and apogee distance. This gives more time during descent on low altitude flights to make all the necessary announcements. Previously, some of the decent phase announcements were getting skipped due to lack of time. The resulting flight commentary is now much cleaner for low altitude flights (less than about 6000 feet). Higher altitude flights are unaffected by this change.

2. Added "REC" to the audio playback page to indicate which recording is being displayed. It was missing when there was only one flight recorded. The page showed "1/1" rather than "REC:1/1".
